MOTIVATION

DNN ACCELERATORS

Design Considerations

DNN ACCELERATORS

Design Considerations

DATA MOVEMENT

Why it's important

Energy costs	
8-bit Integer Multiply	0.2 pJ
Fetch two 8-bit operands from DRAM	128 pJ
Fetch two 8-bit operands from large SRAM	2 pJ

Fortunately...

VGG16 conv 3_2	
Multiply Add Ops	1.85 Billion
Weights	590 K
Inputs	803 K
Outputs	803 K

Re-use

EXPLOITING REUSE

7-dimensional network layer

2D hardware array

Algorithmic Reuse

Hardware Reuse

Convolutional Reuse

- Slide filter over input plane

Input Activation Reuse

- Multiple filter blocks over same inputs

Output Activation Reuse

- Accumulation sum over channels

Batch Reuse

- Re-apply filters to new inputs

Temporal

Multicast

Forwarding

Flexible architectures may allow millions of alternative mappings of a single workload

MAPPING CHOICES

Energy-efficiency of peak-perf mappings of a single problem

480,000 mappings shown

Spread: 19x in energy efficiency

Only 1 is optimal, 9 others within 1%

A **model** needs a **mapper** to evaluate a DNN workload on an architecture

6,582 mappings have min. DRAM accesses but vary 11x in energy efficiency

A **mapper** needs a good cost **model** to find an optimal mapping

TIMELOOP / ACCELERGY

Tools for Evaluation and Architectural Design-Space Exploration of DNN Accelerators

WHY TIMELOOP/ACCELERGY?

Microarchitectural model (Timeloop/Accelergy)

- Expressive: generic, template based hardware model
- Fast: faster than native execution on host CPUs
- Accurate: validated vs. design-specific models

Technology model (Accelergy)

- Allows user-defined complex architectural components
- Plugins for various technology models, e.g., Cacti, Aladdin, proprietary databases

Built-in Mapper (Timeloop)

- Addresses the hard problem of optimizing data reuse, which is required for faithful evaluation of a workload on an architecture

The background is a dark, almost black, field with a complex network of thin, glowing green lines. These lines intersect at various points, creating a web-like structure. At many of these intersection points, there are small, bright green circular dots or nodes. Some of these dots are slightly larger and more prominent than others. The overall effect is one of a dynamic, interconnected system, possibly representing a network or a complex process. The text 'TIMELOOP VALIDATION' is positioned in the lower right quadrant of the image, in a bold, white, sans-serif font.

TIMELOOP VALIDATION

VALIDATION: EYERISS

Vs. ISCA 2016 Eyeriss Energy Model

VALIDATION: SIMBA PE (ENERGY)

VALIDATION: SIMBA PE (PERFORMANCE)

The background is a dark blue gradient with a complex network of thin, light green lines crisscrossing across the frame. Several bright green circular nodes of varying sizes are scattered throughout, some appearing as sharp points of light and others as soft, out-of-focus bokeh. The overall effect is a sense of dynamic connectivity and digital space.

CASE STUDIES

CASE STUDY: TECHNOLOGY MODEL

CASE STUDY: MEM HIERARCHY

The background is a dark blue field with a complex network of thin, light green lines crisscrossing across it. Several bright green dots are scattered throughout, some appearing as nodes in the network. There are also some larger, faint blue circular shapes in the background.

USING TIMELOOP

THE MODEL

INVOKING THE MODEL

Problem

```
for r = [0:R):  
  for s = [0:S):  
    for p = [0:P):  
      for q = [0:Q):  
        for c = [0:C):  
          for k = [0:K):  
            for n = [0:N):  
              Output[p][q][k][n] +=  
                Weight[r][s][k][c] *  
                Input[p+r][q+s][c][n];
```

Mapping

MODEL

EXAMPLE 0: PROBLEM

Conv1D

To represent this...

```
for r = [0:R):  
  for p = [0:P):  
    Output[p] += Weight[r] * Input[p+r];
```

Think about:

And write:

```
problem:  
  shape:  
    name: Conv1D  
    dimensions: [ R, P ]  
    data-spaces:  
      - name: Weights  
        projection:  
          - [ [R] ]  
      - name: Inputs  
        projection:  
          - [ [P], [R] ]  
      - name: Outputs  
        projection:  
          - [ [P] ]  
        read-write: True
```

```
instance:  
  R: 3  
  P: 16
```

EXAMPLE 0: ARCHITECTURE

1-Level Temporal

To represent this...

Write:

```
architecture:
subtree:
- name: PE
  local:
  - name: Buffer
    class: SRAM
    attributes:
      entries: 64
      instances: 1
      word-bits: 8
  - name: MACC
    class: intmac
    attributes:
      word-bits: 8
```

EXAMPLE 0: MAPPING

1-Level Temporal

To represent this...

Write:

mapping:

- target: Buffer
- type: temporal
- factors: R=3 P=16
- permutation: RP

EXAMPLE 0

Run Timeloop model:

```
>> timeloop-model arch.yaml problem.yaml map.yaml
```

Output:

timeloop-model.map.txt

```
Buffer [ Weights:3 Inputs:18 Outputs:16 ]  
-----  
| for P in [0:16)  
|   for R in [0:3)
```

timeloop-model.stats.txt

```
.....  
.....  
Summary Stats  
-----  
Utilization: 1.00  
Cycles: 48  
Energy: 0.00 uJ  
Area: 0.00 mm^2  
  
MACCs = 48  
pJ/MACC  
    MACC                = 0.60  
    Buffer               = 1.54  
    Total                = 2.14
```

EXAMPLE 1: ARCHITECTURE

2-Level Temporal

EXAMPLE 1: MAPPING

Weight Stationary

To represent this...

```
for p1 in [0:1)
  for r1 in [0:3)
    for r0 in [0:1)
      for p0 in [0:16)
        Output[p] += Weight[r] * Input[p+r];
```

Buffer

Expected outputs

Metric	Weights	Inputs	Outputs
Buffer occupancy	1	P	P
MainMemory accesses	R	W	P
Buffer accesses	PR	PR	2PR

Write:

mapping:

- target: MainMemory
type: temporal
factors: R=3 P=1
permutation: RP # inner to outer
- target: Buffer
type: temporal
factors: R=1 P=16
permutation: PR # inner to outer

EXAMPLE 1: MAPPING

Output Stationary

To represent this...

```
for r1 in [0:1)
  for p1 in [0:16)
    for p0 in [0:1)
      for r0 in [0:3)
        Output[p] += Weight[r] * Input[p+r];
```

Buffer

Expected outputs

Metric	Weights	Inputs	Outputs
Buffer occupancy	R	R	1
MainMemory accesses	R	W	P
Buffer accesses	PR	PR	2PR

Write:

mapping:

- target: MainMemory
type: temporal
factors: R=1 P=16
permutation: PR
- target: Buffer
type: temporal
factors: R=3 P=1
permutation: RP

EXAMPLE 2: PROBLEM

Conv1D + Output Channels

To represent this...

```
for k = [0:K)
  for r = [0:R):
    for p = [0:P):
      Output[k][p] += Weight[k][r] * Input[p+r];
```

Think about:

And write:

```
problem:
  shape:
    name: Conv1D
    dimensions: [ K, R, P ]
    data-spaces:
      - name: Weights
        projection:
          - [ [K] ]
          - [ [R] ]
      - name: Inputs
        projection:
          - [ [P], [R] ]
      - name: Outputs
        projection:
          - [ [K] ]
          - [ [P] ]
    read-write: True
```

```
instance:
  K: 32
  R: 3
  P: 16
```

EXAMPLE 2: MAPPINGS

Untiled vs. K-tiled

Untiled

```
for k1 in [0:32)
  for p1 in [0:16)
    for r1 in [0:1)
```

```
      for k0 in [0:1)
        for p0 in [0:1)
          for r0 in [0:3)
            Output[p] += Weight[r] * Input[p+r];
```

Buffer

K-tiled

```
for k1 in [0:16)
  for p1 in [0:16)
    for r1 in [0:1)
```

```
      for k0 in [0:2)
        for p0 in [0:1)
          for r0 in [0:3)
            Output[p] += Weight[r] * Input[p+r];
```

Buffer

mapping:

- target: MainMemory
type: temporal
factors: R=1 P=16 K=32
permutation: RPK

- target: Buffer
type: temporal
factors: R=3 P=1 K=1
permutation: RPK

mapping:

- target: MainMemory
type: temporal
factors: R=1 P=16 **K=16**
permutation: RPK

- target: Buffer
type: temporal
factors: R=3 P=1 **K=2**
permutation: RPK

EXAMPLE 2: O.S. DATAFLOW VARIANTS

Alg. min. MainMemory accesses

Weights	Inputs	Outputs
KR	W	KP

Buffer occupancy

Weights	Inputs	Outputs
R	R	1
R	R	1
R	W	1
KR	R	1
$K_b R$	R	1
R	$R+P_b-1$	1

MainMemory accesses

Weights	Inputs	Outputs
KR	KW	KP
KPR	W	KP
KR	W	KP
KR	W	KP
KR	$(K/K_b)W$	KP
$K(P/P_b)R$	W	KP

$$\bigvee_{k=1}^K \bigvee_{p=1}^P \bigvee_{r=1}^R (O_{kp} += W_{kr} I_{p+r-1})$$

$$\bigvee_{p=1}^P \bigvee_{k=1}^K \bigvee_{r=1}^R (O_{kp} += W_{kr} I_{p+r-1})$$

$$\bigvee_{k_1=1}^{K_1} \bigvee_{p=1}^P \bigvee_{k_0=1}^{K_0} \bigvee_{r=1}^R (O_{kp} += W_{kr} I_{p+r-1})$$

where $K = K_1 \times K_0$ and $k = k_1 K_0 + k_0$

$$\bigvee_{p_1=1}^{P_1} \bigvee_{k=1}^K \bigvee_{p_0=1}^{P_0} \bigvee_{r=1}^R (O_{kp} += W_{kr} I_{p+r-1})$$

where $P = P_1 \times P_0$ and $p = p_1 P_0 + p_0$

EXAMPLE 3: ARCHITECTURE

3-Level Temporal

EXAMPLE 3B: BYPASSING LEVELS

3-Level Temporal with Level Bypassing

mapping:

...

- target: GlobalBuffer
type: bypass
keep:
 - Weights # same as default
 - Inputs # same as defaultbypass:
 - Outputs # override
- target: RegisterFile
type: bypass
keep:
 - Outputs # same as defaultbypass:
 - Weights # override
 - Inputs # override

EXAMPLE 3B: BYPASSING

Bypassing

- Avoids energy cost of reading and writing buffers
- May result in additional accesses to outer buffers
- Does not change energy cost of moving data over network wires

For brevity in expressing mappings, Timeloop's model application assumes each data space is stored at each level.

- We will see later that Timeloop's *mapper* makes no such assumption

EXAMPLE 4: SPATIAL INSTANCES

3-Level with multiple PEs

```
architecture:
  subtree:
    - name: System
      local:
        - name: MainMemory
          class: DRAM
          attributes:
            .....
      subtree:
        - name: Chip
          local:
            - name: GlobalBuffer
              class: SRAM
              attributes:
                .....
          subtree:
            - name: PE[0..15]
              local:
                - name: RegisterFile
                  class: regfile
                  attributes:
                    .....
                - name: MACC
                  class: intmac
                  attributes:
                    .....
```

EXAMPLE 4: MAPPING

Spatial levels need loops too

To represent this...

Write:

mapping:

- target: MainMemory
type: temporal
factors: R=1 P=1 K=1
permutation: PRK
- target: GlobalBuffer
type: temporal
factors: R=3 P=1 K=2
permutation: PRK
- target: GlobalBuffer
type: spatial
factors: R=1 P=1 K=16
permutation: PRK
- target: RegisterFile
type: temporal
factors: R=1 P=16 K=1
permutation: PRK

EXAMPLE 4: SPATIAL INSTANCES

Spatial levels need to be mapped.

By convention, a block of `spatial_for` loops representing a spatial fanout from storage level *Outer* to storage level *Inner* are described as a spatial mapping directive targeted at level *Outer*.

Specifying complete mappings manually is beginning to get tedious. Space of choices and consequences is getting larger. Moving to realistic problem shapes and hardware topologies, we get a combinatorial explosion.

Fortunately, Timeloop's mapper was built exactly for this.

The background is a dark blue field with a complex network of thin, light green lines crisscrossing across it. Several bright green dots are scattered throughout, some appearing as nodes in the network. There are also some larger, faint blue circular shapes in the background.

USING TIMELOOP

THE MAPPER

INVOKING THE MAPPER

To understand how the mapper works, let's go back to a simpler hardware architecture.

EXAMPLE 5: MAPSPACE

Arch: 3-Level, Problem: 1D + Output Channels

Recall:

mapping:

- target: MainMemory
type: temporal
factors: R=1 P=16 K=4
permutation: RPK
- target: GlobalBuffer
type: temporal
factors: R=3 P=1 K=2
permutation: RPK
- target: RegisterFile
type: temporal
factors: R=1 P=1 K=4
permutation: RPK

Mapper constructs a mapping template:

mapping:

- target: MainMemory
type: temporal
factors: R=_ P=_ K=_
permutation: _ _ _
- target: GlobalBuffer
type: temporal
factors: R=_ P=_ K=_
permutation: _ _ _
- target: RegisterFile
type: temporal
factors: R=_ P=_ K=_
permutation: _ _ _

EXAMPLE 5: MAPSPACE

Arch: 3-Level, Problem: 1D + Output Channels

Mapspace: An enumeration of ways to fill in these red blanks:

- Factors
- Permutations
- Dataspace Bypass*

* = not shown in example

Mapper constructs a mapping template:

mapping:

- target: MainMemory
type: temporal
factors: R= _ P= _ K= _
permutation: _ _ _
- target: GlobalBuffer
type: temporal
factors: R= _ P= _ K= _
permutation: _ _ _
- target: RegisterFile
type: temporal
factors: R= _ P= _ K= _
permutation: _ _ _

EXAMPLE 5: MAPSPACE

Arch: 3-Level, Problem: 1D + Output Channels

Mapspace: An enumeration of ways to fill in these red blanks:

- Factors
- Permutations
- Dataspace Bypass

Mapspaces can be **constrained** by the user.

- Architecture constraints
- Mapspace constraints

Mapper constructs a mapping template:

mapping:

- target: MainMemory
type: temporal
factors: R= _ P= _ K= _
permutation: _ _ _
- target: GlobalBuffer
type: temporal
factors: R= _ P= _ K= _
permutation: _ _ _
- target: RegisterFile
type: temporal
factors: R= _ P=**1** K=**1**
permutation: **R** _ _

Arch: 3-Level, Problem: 1D + Output Channels

- Factors
- Permutations
- Dataspace Bypass

- Architecture constraints
- Mapspace constraints

Mapper runs a search heuristic over the constrained mapspace

mapping:

```
- target: GlobalBuffer
  type: temporal
  factors: R= P= K=
  permutation: 
```

```
- target: RegisterFile
  type: temporal
  factors: R=   P=1 K=1
  permutation: R      
```

TUNING THE MAPPER'S SEARCH

Search heuristics (as of this recording)

- Linear
- Random
- Hybrid

Optimization criteria: prioritized list of statistics emitted by the model, e.g.,

- [cycles, energy]
- [last-level-accesses]

Termination conditions

- Mapspace exhausted
- #Valid mappings encountered $\geq$ “search-size”
- #Consecutive invalid mappings encountered $\geq$ “timeout”
- #Consecutive sub-optimal valid mappings encountered $\geq$ “victory-condition”
- Ctrl+C

The background is a dark blue field with a network of thin, light green lines connecting various points. These points are represented by small, bright green circles of varying sizes, some of which have a soft glow. The lines and dots create a sense of depth and connectivity, resembling a complex network or a stylized constellation.

DEEP DIVE: UNDERSTANDING THE MAPPER

CONSTRAINING A MAPSPACE

CONSTRAINING A MAPSPACE

PRUNING A MAPSPACE

PRUNING A MAPSPACE

THE MAPPER

MULTI-THREADING

Can also split along other dimensions

The background is a dark blue gradient with a complex network of thin, light green lines crisscrossing across the frame. Several bright green circular nodes of varying sizes are scattered throughout, some appearing as points where lines intersect. The overall aesthetic is high-tech and digital.

DEEP DIVE: UNDERSTANDING THE MODEL

THE MODEL

THE MODEL: TILE ANALYSIS

Mapping

```
for ...  
  for p=[0:8)  
    for ...  
      for ...
```

Determines
tiles, spatial
partitioning of
tiles, and
schedule

Point sets: at each loop iteration (time step OR instance of a hardware unit)

Deltas: set-difference between point sets

- Temporal: Indicates stationarity, sliding-window behavior, etc.
- Spatial: Indicates overlaps/halos between adjacent units, multicasting/forwarding opportunities

Tile Analysis: Measure and record deltas over all space and time.

Naïve but robust approach:
simulate execution of entire loop nest.

Regular problems:

- Compute 1st, 2nd, and last iterations of each loop
- Point sets are Axis-Aligned Hyper Rectangles (AAHR)

THE MODEL: UARCH MODEL

ESTIMATING PERFORMANCE AND ENERGY

Performance: Throughput of rate-limiting step across:

- Multipliers
- Buffer read/write ports
- Networks

Assumption: Buffers are either double-buffered or use **buffets***

Energy: summation of costs for various activities:

- Multiplier accesses
- Buffer accesses
- Network transfers
- Temporal and spatial accumulations
- Address-generator in

What are the per-activity costs?

* **Buffets: An Efficient and Composable Storage Idiom for Explicit Decoupled Data Orchestration**; Michael Pellauer, Yakun Sophia Shao, Jason Clemons, Neal Crago, Kartik Hegde, Rangarajan Venkatesan, Stephen W. Keckler, Christopher W Fletcher, Joel Emer; *ASPLOS 2019*

FUTURE WORK

Search Heuristics

Workloads: Complete networks, with inter-layer optimization

Compressed-sparse architectures: modeling fragmentation, load imbalance and metadata overheads

TIMELoop

Timeloop aims to serve as a vehicle for quality research on flexible DNN accelerator architectures. The infrastructure is released at <https://github.com/NVlabs/timeloop> under a BSD license.

Please join us in making Timeloop better and more useful for research opportunities across the community.
